## KEPServerEX V5 Install Switches and How to Perform a Silent Installation

### 1. Overview

This document intends to discuss the switches that are available for the server installation, and how they are used to create and execute a silent installation.

### 2. Server Install Switches

Switches are case sensitive, and must be in lowercase characters. Descriptions of the switches are as follows:

#### 2.1 /? - Help

This switch displays all available switches.

#### 2.2 /q[x] - Installation Mode

This switch manages the user interface.

##### 2.2.1 /qn - Silent Installation Mode

This switch performs a silent installation. This method requires the install INI file (including all user-specified installation settings). To obtain an INI template, use the "/w" switch.

##### 2.2.2 /qf - Full Installation Mode

This switch is the default setting for a full installation interface.

##### 2.2.3 /qb - Silent Installation Mode with Progress Bar

This switch performs a silent installation, but also displays a progress bar.

## Technical Notice Reference

### 09-005a

#### 2.3 /p – Hard Drive Check Override

This switch allows the server installation to override or bypass the hard drive check (which verifies that the server is not being installed to removable media). This switch is helpful because some permanent drivers may be incorrectly reported as removable media.

#### 2.4 /lv – Verbose Logging

This switch increases the level of messages that will be logged to the install log. An install log is kept of the installation's progress by default, and will be placed in a temporary folder. The default location is usually *Documents and Settings\<User>\Local Settings\Temp*, and can be verified through the System Environment Variables.

**Note:** As of server version 5.5, the default behavior is verbose logging.

#### 2.5 /w – Write Installation INI

This switch records the installation, and writes the install INI file to the folder in which the installation executable is running. To perform a silent install, users must run the install with a "/qn" or "/qb" switch. The INI file must reside in that folder.

#### 2.6 /x - Uninstall

This switch uninstalls the server.

## 3. Creating the Silent Install INI File

The silent install INI file directs the installation process. For more information, refer to the instructions below.

1. To start, create the install INI file. Then, open the Command Prompt.
2. Next, run the server install using the "/w" switch. For example, enter "KEPServerEx5.exe /w".
3. Next, specify the options that will be included in the silent installation.

**Note 1:** Users can modify the installation at any time by manually editing the INI file.

**Note 2:** Comments in file (which are the lines that start with a semicolon) explain the meaning of all keys (which are the lines that contain an equal sign).

## 4. Running the Silent Install

For more information, refer to the instructions below.

1. To start, open the Command Prompt.
2. Next, run the server install using the "/qf" switch to display the user interface.

**Note:** The INI file must reside in the same folder as the installation executable.

3. Verify that the settings specified in the INI file are reflected in the user interface. Then, modify the INI file as necessary.
4. Repeat the validation process until the installation runs as expected.

## Technical Notice Reference

### 09-005a

5. Next, use the "/qn" switch to run the installation without the user interface. For example, enter "KEPServerEx5.exe /qn".

**Note:** The user interface and installation options may change if more features and drivers are added to the server. As such, it is recommended that a new INI file be created with each new server release. This will ensure its interoperability with the server installation executable.
